

CASE STUDY: Baked Chicken Farm (BCF)

Overview

Baked Chicken Farm (BCF) is a New Mexico-based cannabis dispensary that launched with The Peak Beyond's interactive display technology integrated from day one. The store prioritizes relaxed, high-engagement customer experiences and operates within a compact retail footprint, serving approximately 60 customers per day. TPB displays help BCF present their full catalog of in-house and third-party products in a limited physical space.

Challenge

BCF needed to:

- Maximize product visibility despite limited shelving and counter space.
- Empower customers to explore and self-educate.
- Reduce friction in the shopping experience.
- Build a brand identity rooted in modern, tech-forward retail.

This was especially important in a state like New Mexico, where cannabis sales topped \$300 million in the first full year of adult-use legalization (New Mexico Cannabis Control Division, 2023). The average transaction value for adult-use purchases sits around \$43.82—a figure that has been trending downward as the market matures. In such a competitive and price-sensitive market, increasing basket size and creating customer stickiness are essential to long-term success.

TPB Display Solution

TPB's interactive displays provide:

- Guided product browsing with real-time inventory visibility.
- Filters by brand, category, and effect.
- Visuals and educational content to support decision-making.

Displays are placed strategically to support both independent browsing and staff-led product exploration. According to BCF, customers often linger in the store, preferring to browse at their own pace, and the displays naturally support this behavior. Staff regularly use the displays to walk customers through inventory, images, and pricing, making it easier to have informative, visually guided conversations—especially valuable during busy hours when fewer employees are available.

Research shows that customers who interact with digital content are significantly more likely to make a purchase—and to spend more when they do. Self-service kiosks in retail environments have been shown to increase average order size by 15–30% (Samsung Insights, 2022; Kiosk Marketplace, 2021), with longer dwell times correlating to more robust customer engagement.

Customer Engagement Insights

- **Average session duration:** ~16 minutes
- **Average clicks per session:** ~11
- **Recent session volume:** 4,751 sessions recorded over a two-month period (April–May 2025)
- **Average customer dwell time in store:** 15 minutes
- **Average time using displays:** 10 minutes
- **Average time shopping at the counter:** 5 minutes

Popular Categories

- **Flower:** 4,272 views
- **Pre-rolls:** 603 views
- **Concentrates:** 140 views

Brand Discovery

- **BCF's house brand:** 3,558 interactions
- Other leading brands: Royal Cannabis and Lucky Cultivation

Basket Size Performance

BCF's kiosk-driven carts average **\$49.70**—significantly higher than the **\$43.82** average adult-use transaction size in New Mexico. This represents a **13.5% uplift**, highlighting the effectiveness of TPB displays in influencing purchase behavior. Retail studies show that interactive kiosks not only improve product education, but also drive larger average purchases by exposing customers to a wider array of products and promotional messaging (Samsung Insights, 2022).

Customer Sentiment

"Most amazing dispensary I've ever been to. From the lift and learn kiosks... I was in awe. Absolutely loved the concept!"

Operational Feedback New Mexico's cannabis market is crowded and rapidly maturing, with over 1,000 licensed dispensaries statewide and average per-store sales under \$900,000 annually. In this environment, operational efficiency and customer satisfaction are key differentiators. BCF's model illustrates how interactive displays can drive both.

The store averages 64 in-store transactions per day and operates with a small team: 4–5 staff during busy hours, and just 2 during slower times. Typically, 2 employees are available on the sales floor assisting one or two customers each. TPB displays help the team manage foot traffic more efficiently by providing self-guided browsing experiences—particularly useful when staff are occupied or unavailable.

Displays are also instrumental in reducing dwell time at the counter by allowing customers to complete much of their research beforehand. BCF has shared that the displays not only speed up the sales cycle for customers who prefer quick transactions, but also help reduce the overall staffing required to serve their daily traffic. This leads to a smoother checkout process and faster throughput during peak periods. For customers who know what they want, the displays accelerate the purchase flow. For those who want to explore, they offer an intuitive and private experience, surfacing additional inventory not visible on shelves.

BCF staff have also noted that customers consistently enjoy browsing by brand, category, and effect. The ability to interact with the display independently resonates with their preference to linger and explore. Additionally, BCF's third-party vendors appreciate how their products are visually represented—adding promotional value and brand awareness. The displays contribute to a differentiated shopping journey by educating customers on pricing, effects, and packaging, while also supporting stronger merchandising.

Differentiation

BCF attributes its standout market presence in part to the use of TPB's displays, which offer a unique customer experience unmatched by other local dispensaries. In a state with over 1,000 licensed dispensaries and average per-store sales under \$900,000 (Cannabis Business Times, 2024), tech-enabled experiences like these can be a key advantage.

Conclusion

BCF successfully launched a modern cannabis retail environment by integrating TPB's interactive display technology. Through enhanced product visibility, elevated basket sizes, and high customer satisfaction, BCF demonstrates how thoughtful tech deployment can define both shopper experience and brand identity from day one.
